

## TPS22968 Dual Channel, Ultra-Low Resistance Load Switch

### 1 Features

- Integrated Dual Channel Load Switch
- Input Voltage Range: 0.8 V to 5.5 V
- VBIAS Voltage Range: 2.5 V to 5.5 V
  - Ideal for 1S Battery Configuration
- Ultra-Low  $R_{ON}$  Resistance
  - $R_{ON} = 27\text{ m}\Omega$  at  $V_{IN} = 5\text{ V}$  ( $V_{BIAS} = 5\text{ V}$ )
  - $R_{ON} = 25\text{ m}\Omega$  at  $V_{IN} = 3.3\text{ V}$  ( $V_{BIAS} = 5\text{ V}$ )
  - $R_{ON} = 25\text{ m}\Omega$  at  $V_{IN} = 1.8\text{ V}$  ( $V_{BIAS} = 5\text{ V}$ )
- 4-A Maximum Continuous Switch Current per Channel
- Low Quiescent Current
  - $55\text{ }\mu\text{A}$  at  $V_{BIAS} = 5\text{ V}$  (Both Channels)
  - $55\text{ }\mu\text{A}$  at  $V_{BIAS} = 5\text{ V}$  (Single Channel)
- Low Control Input Threshold Enables Use of 1.2-, 1.8-, 2.5-, 3.3-V Logic
- Configurable Rise Time<sup>(1)</sup>
- Quick Output Discharge (QOD)<sup>(2)</sup> (Optional)
- SON 14-Pin Package with Thermal Pad
- ESD Performance Tested per JEDEC Standard
  - 2-kV HBM and 1-kV CDM
- Latch-Up Performance Exceeds 100 mA per JESD 78, Class II
- GPIO Enable – Active High
- TPS22968N: Product Preview Only

(1) See the [Application Information](#) section for CT value vs. rise time

(2) This feature discharges the output of the switch to GND through a 270- $\Omega$  resistor, preventing the output from floating.

### 2 Applications

- Ultrabook™
- Notebooks and Netbooks
- Tablets
- Consumer Electronics
- Set-Top Boxes
- Telecom Systems

### 3 Description

The TPS22968x is a small, ultra-low  $R_{ON}$ , dual-channel load switch with controlled turn on. The device contains two N-channel MOSFETs that can operate over an input voltage range of 0.8 to 5.5 V and can support a maximum continuous current of 4 A per channel. Each switch is independently controlled by an on and off input (ON1 and ON2), which is capable of interfacing directly with low-voltage control signals. In TPS22968, a 270- $\Omega$  on-chip load resistor is added for output quick discharge when switch is turned off.

The TPS22968x is available in a small, space-saving package (DPU) with integrated thermal pad allowing for high power dissipation. The device is characterized for operation over the free-air temperature range of  $-40$  to  $+105^{\circ}\text{C}$ .

#### Device Information <sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS22968 TPS22968N	WSON (14)	3.00 mm x 2.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Device Comparison

DEVICE	Ron (typ) at VIN = 3.3 V, VBIAS = 5 V	QUICK OUTPUT DISCHARGE	MAXIMUM OUTPUT CURRENT	ENABLE
TPS22968	25 mΩ	Yes	4 A	Active High
TPS22968N	25 mΩ	No	4 A	Active High

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	VIN1	I	Switch 1 input. Bypass this input with a ceramic capacitor to GND
2			
3	ON1	I	Active-high switch 1 control input. Do not leave floating
4	VBIAS	I	Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2.5 V to 5.5 V. See the <a href="#">VIN and VBIAS Voltage Range</a> section
5	ON2	I	Active-high switch 2 control input. Do not leave floating
6	VIN2	I	Switch 2 input. Bypass this input with a ceramic capacitor to GND
7			
8	VOUT2	O	Switch 2 output
9			
10	CT2	O	Switch 2 slew rate control. Can be left floating
11	GND	—	Ground
12	CT1	O	Switch 1 slew rate control. Can be left floating
13	VOUT1	O	Switch 2 output
14			
15	Thermal Pad	—	Thermal pad (exposed center pad) to alleviate thermal stress. Tie to GND. See the <a href="#">Application Information</a> section for layout guidelines

## 7 Specifications

### 7.1 Absolute Maximum Ratings

Over operating free-air temperature (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT <sup>(2)</sup>
V <sub>IN1,2</sub>	Input voltage	-0.3	6	V
V <sub>BIAS</sub>	Bias voltage	-0.3	6	V
V <sub>OUT1,2</sub>	Output voltage	-0.3	6	V
V <sub>ON1,2</sub>	ON voltage	-0.3	6	V
I <sub>MAX</sub>	Maximum continuous switch current per channel, T <sub>A</sub> = 30 °C		4	A
I <sub>PLS</sub>	Maximum pulsed switch current, pulse < 300 μs, 2% duty cycle		6	A
T <sub>J</sub>	Maximum junction temperature		125	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to network ground terminal.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

### 7.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V <sub>IN1,2</sub>	Input voltage	0.8	V <sub>BIAS</sub>	V
V <sub>BIAS</sub>	Bias voltage	2.5	5.5	V
V <sub>ON1,2</sub>	ON voltage	0	5.5	V
V <sub>OUT1,2</sub>	Output voltage		V <sub>IN</sub>	V
V <sub>IH, ON1,2</sub>	High-level input voltage, ON1,2	V <sub>BIAS</sub> = 2.5 V to 5.5 V		V
V <sub>IL, ON1,2</sub>	Low-level input voltage, ON1,2	V <sub>BIAS</sub> = 2.5 V to 5.5 V		V
C <sub>IN1,2</sub>	Input capacitor	1 <sup>(1)</sup>		μF
T <sub>A</sub>	Operating free-air temperature <sup>(2)</sup>	-40	105	°C

- See the [Application Information](#) section.
- In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [T<sub>A(max)</sub>] is dependent on the maximum operating junction temperature [T<sub>J(max)</sub>], the maximum power dissipation of the device in the application [P<sub>D(max)</sub>], and the junction-to-ambient thermal resistance of the part/package in the application (R<sub>θJA</sub>), as given by the following equation: T<sub>A(max)</sub> = T<sub>J(max)</sub> - (R<sub>θJA</sub> × P<sub>D(max)</sub>).

### 7.4 Thermal Information

	THERMAL METRIC <sup>(1)</sup> (2)	TPS22968	UNIT
		DPU (WSON)	
		14 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	62.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	70.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	23.2	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	2.5	°C/W

- For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- For thermal estimates of this device based on PCB copper area, see the [TI PCB Thermal Calculator](#).

**Thermal Information (continued)**

THERMAL METRIC <sup>(1)</sup> <sup>(2)</sup>		TPS22968	UNIT
		DPU (WSON)	
		14 PINS	
$\psi_{JB}$	Junction-to-board characterization parameter	23.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	9	°C/W

**7.5 Electrical Characteristics ( $V_{BIAS} = 5\text{ V}$ )**

Unless otherwise noted, the specification in the following table applies over the operating ambient temperature  $-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$  (full) and  $V_{BIAS} = 5\text{ V}$ . Typical values are for  $T_A = 25^{\circ}\text{C}$  (unless otherwise noted).

## 9 Detailed Description

### 9.1 Overview

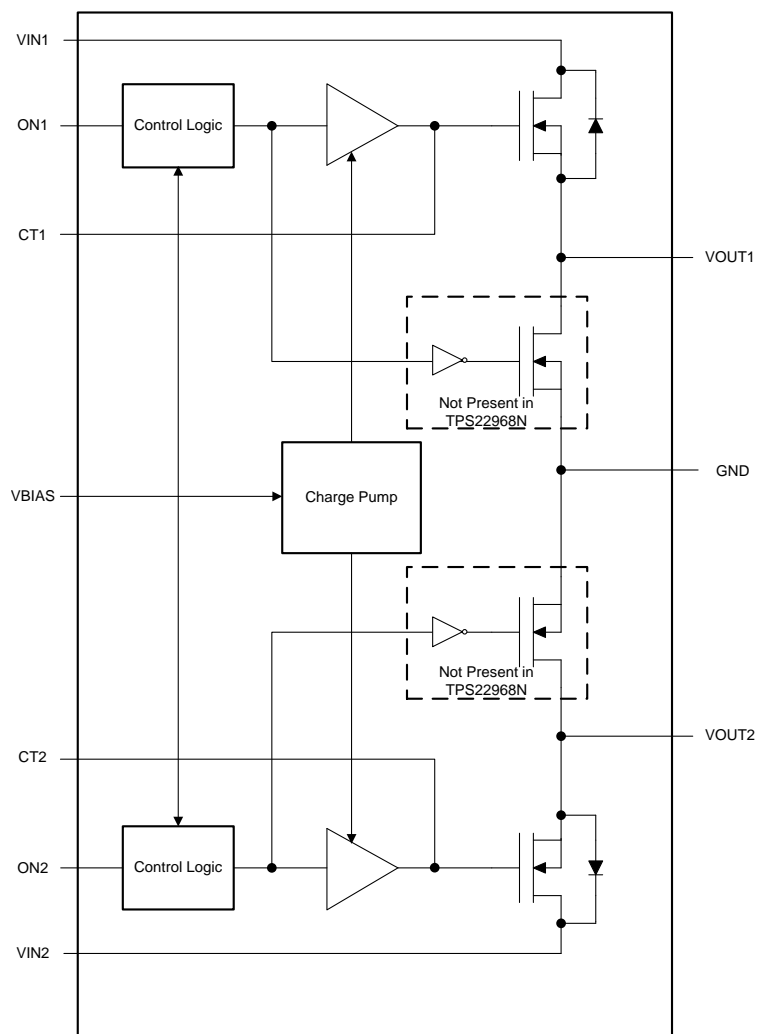

The TPS22968 is a 5.5-V, 4-A, dual-channel ultra-low  $R_{ON}$  load switch with controlled turnon. The device contains two N-channel MOSFETs. Each channel can support a maximum continuous current of 4 A and is controlled by an on and off GPIO-compatible input. The ON pin must be connected and cannot be left floating. The device is designed to control the turnon rate and therefore the inrush current. By controlling the inrush current, power supply sag can be reduced during turnon. The slew rate for each channel is set by connecting a capacitor to GND on the CT pins.

The slew rate is proportional to the capacitor on the CT pin. See the [Adjustable Rise Time](#) section to determine the correct CT value for a desired rise time.

The internal circuitry is powered by the VBIAS pin, which supports voltages from 2.5 V to 5.5 V. This circuitry includes the charge pump, QOD (optional), and control logic. For these internal blocks to function correctly, a voltage between 2.5 V and 5.5 V must be supplied to VBIAS.

When a voltage is supplied to VBIAS, the ON1 pin goes low, and the ON2 pins go low, the QOD turns on. This connects VOUT1 and VOUT2 to GND through an on-chip resistor. The typical pulldown resistance ( $R_{PD}$ ) is 270  $\Omega$ .

### 9.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

### 9.3 Feature Description

#### 9.3.1 ON and OFF Control

The ON pins control the state of the switch. Asserting ON high enables the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be tied either high or low for proper functionality.

#### 9.3.2 Input Capacitor (Optional)

When the switch turns on into a discharged load capacitor or short-circuit, a capacitor must be placed between VIN and GND to limit the voltage drop on the input supply caused by transient inrush currents. A 1- $\mu$ F ceramic capacitor ( $C_{IN}$ ), placed close to the pins, is sufficient. Higher values of  $C_{IN}$  can be used to further reduce the voltage drop during high-current application. When switching heavy loads, TI recommends having an input capacitor 10x higher than the output capacitor to avoid excessive voltage drop.

#### 9.3.3 Output Capacitor (Optional)

TI highly recommends a  $C_{IN}$  greater than  $C_L$ , because of the integrated body diode in the NMOS switch. A  $C_L$  greater than  $C_{IN}$  can cause the voltage on VOUT to exceed VIN when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. TI recommends a  $C_{IN}$  to  $C_L$  ratio of 10 to 1 for minimizing  $V_{IN}$  dip caused by inrush currents during startup.

#### 9.3.4 QOD (Optional)

The TPS22968 includes a QOD feature. When the switch is disabled, a discharge resistor is connected between VOUT and GND. This resistor has a typical value of 270  $\Omega$  and prevents the output from floating while the switch is disabled.

#### 9.3.5 VIN and VBIAS Voltage Range

For optimal  $R_{ON}$  performance, make sure  $V_{IN} \leq V_{BIAS}$ . The device is still functional if  $V_{IN} > V_{BIAS}$ , but it exhibits  $R_{ON}$  greater than what is listed in the *Electrical Characteristics ( $V_{BIAS} = 5 V$ )* and *Electrical Characteristics ( $V_{BIAS} = 2.5 V$ )* table. See Figure 30 for an example of a typical device. Notice the increasing  $R_{ON}$  as  $V_{IN}$  exceeds  $V_{BIAS}$  voltage. Be sure to never exceed the maximum voltage rating for  $V_{IN}$  and  $V_{BIAS}$ .

Temperature = 25°C

$I_{OUT} = 200 \text{ mA}$

Figure 30. On-Resistance vs Input Voltage

## Feature Description (continued)

### 9.3.6 Adjustable Rise Time

A capacitor to GND on the CT pins sets the slew rate for each channel. The capacitor to GND on the CT pins must be rated for 25 V and above. An approximate formula for the relationship between CT and slew rate with  $V_{BIAS} = 5\text{ V}$  is shown in [Equation 1](#).

$$SR = 0.32 \times CT + 13.7$$

where

- SR is the slew rate (in  $\mu\text{s/V}$ )
- CT is the capacitance value on the CT pin (in pF)
- The units for the constant 13.7 is in  $\mu\text{s/V}$ .

(1)

Rise time can be calculated by multiplying the input voltage by the slew rate. [Table 1](#) contains rise time values measured on a typical device.

**Table 1. Rise Time Table**

CTx (pF)	Typical values at 25°C with a 25-V X7R 10% ceramic capacitor on CT <sup>(1)</sup>						
	VIN = 5 V	VIN = 3.3 V	VIN = 2.5 V	VIN = 1.8 V	VIN = 1.5 V	VIN = 1.2V	VIN = 0.8 V
0	65	48	41	35	31	29	24
220	378	253	197	152	131	111	83
470	704	474	363	272	234	192	140

H	On	Off

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

This section highlights some of the design considerations for implementing this device in various applications. A PSPICE model for this device is also available on the [product page](#) for additional information.

#### 10.1.1 Parallel Configuration

To increase the current capabilities and lower the  $R_{ON}$  by approximately 50%, both channels can be placed in parallel as shown in [Figure 31](#) (parallel configuration). With this configuration, the CT1 and CT2 pins can be tied together to use one capacitor, CT, as shown in [Figure 31](#). With a single CT capacitor, the rise time is half of the typical rise-time value. Refer to the [Table 1](#) for typical timing values.

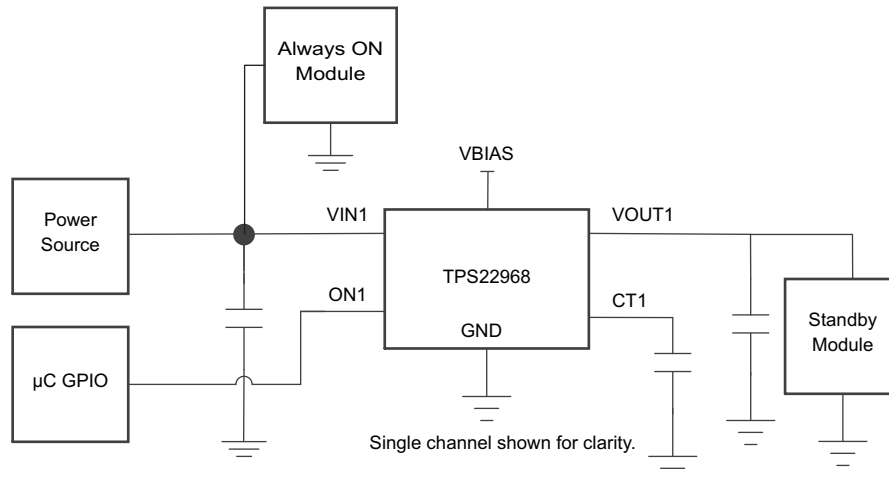

Figure 31. Parallel Configuration

## Application Information (continued)

### 10.1.2 Standby Power Reduction

Any end equipment that is powered from the battery has a need to reduce current consumption to keep the battery charged for a longer time. TPS22968 helps to accomplish this by turning off the supply to the modules that are in standby state, and therefore, significantly reduces the leakage current overhead of the standby modules. See [Figure 32](#).

**Figure 32. Standby Power Reduction**

### 10.1.3 Power Supply Sequencing Without a GPIO Input

In many end equipments, there is a need to power up various modules in a predetermined manner. The TPS22968 can solve the problem of power sequencing without adding any complexity to the overall system. See [Figure 33](#).

VIN1 must be greater  $V_{IH}$ .

**Figure 33. Power Sequencing Without a GPIO Input**

**Application Information (continued)**

**10.1.4 Reverse Current Blocking**

In certain applications, it may be desirable to have reverse current blocking. Reverse current blocking prevents current from flowing from the output to the input of the load switch when the device is disabled. With the following configuration, the TPS22968 can be converted into a single-channel switch with reverse current blocking. In this configuration, VIN1 or VIN2 can be used as the input and VIN2 or VIN1 is the output. See [Figure 34](#).

**Figure 34. Reverse Current Blocking**

## 10.2 Typical Application

This application demonstrates how the TPS22968 can be used to power downstream modules with large capacitances. The example in [Figure 35](#) TPS22968 is powering a 100-μF capacitive output load.

Copyright © 2016, Texas Instruments Incorporated

**Figure 35. Typical Application Schematic for Powering a Downstream Module**

### 10.2.1 Design Requirements

For this design example, use the following [Table 3](#) as the input parameters.

**Table 3. Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
$V_{IN}$	3.3 V
$V_{BIAS}$	5 V
Load current	4 A
Output capacitance ( $C_L$ )	22 μF
Allowable inrush current on VOUT	0.33 A

### 10.2.2 Detailed Design Procedure

To begin the design process, the designer must know the following:

- $V_{IN}$  voltage
- $V_{BIAS}$  voltage
- Load current
- Allowable inrush current on VOUT due to  $C_L$  capacitor

#### 10.2.2.1 $V_{IN}$ to $V_{OUT}$ Voltage Drop

The  $V_{IN}$  to  $V_{OUT}$  voltage drop in the device is determined by the  $R_{ON}$  of the device and the load current. The  $R_{ON}$  of the device depends upon the  $V_{IN}$  and  $V_{BIAS}$  conditions of the device. Refer to the  $R_{ON}$  specification of the device in the [Electrical Characteristics \( \$V\_{BIAS} = 5 V\$ \)](#) and [Electrical Characteristics \( \$V\_{BIAS} = 2.5 V\$ \)](#). After the  $R_{ON}$  of the device is determined based upon the  $V_{IN}$  and  $V_{BIAS}$  conditions, use [Equation 2](#) to calculate the  $V_{IN}$  to  $V_{OUT}$  voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON}$$

where

- $\Delta V$  is the voltage drop from  $V_{IN}$  to  $V_{OUT}$
- $I_{LOAD}$  is the load current
- $R_{ON}$  is the On-resistance of the device for a specific  $V_{IN}$  and  $V_{BIAS}$  combination

An appropriate  $I_{LOAD}$  must be chosen such that the  $I_{MAX}$  specification of the device is not violated.

#### 10.2.2.2 Inrush Current

To determine how much inrush current is caused by the  $C_L$  capacitor, use [Equation 3](#).

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- $I_{\text{INRUSH}}$  is the amount of inrush caused by  $C_L$
  - $C_L$  is the capacitance on VOUT
  - $dt$  is the time it takes for change in  $V_{\text{OUT}}$  during the ramp up of VOUT when the device is enabled
  - $dV_{\text{OUT}}$  is the change in  $V_{\text{OUT}}$  during the ramp up of VOUT when the device is enabled
- (3)

The device offers adjustable rise time for VOUT. This feature allows the user to control the inrush current during turnon through the CTx pins. The appropriate rise time can be calculated using the design requirements and the inrush current equation ( [Equation 3](#)). See [Equation 4](#) and [Equation 5](#).

$$330 \text{ mA} = 22 \text{ } \mu\text{F} \times 3.3 \text{ V} / dt \quad (4)$$

$$dt = 220 \text{ } \mu\text{s} \quad (5)$$

To ensure an inrush current of less than 330 mA, choose a CT based on [Table 1](#) or [Equation 1](#) value that yields a rise time of more than 220  $\mu\text{s}$ . See the oscilloscope captures in the [Application Curves](#) for an example of how the CT capacitor can be used to reduce inrush current. See [Table 1](#) for correlation between rise times and CT values.

An appropriate  $C_L$  value must be placed on VOUT such that the  $I_{\text{MAX}}$  and  $I_{\text{PLS}}$  specifications of the device are not violated.

### 10.2.2.3 Thermal Considerations

The maximum IC junction temperature must be restricted to 125°C under normal operating conditions. To calculate the maximum allowable dissipation,  $P_{\text{D(max)}}$  for a given output current and ambient temperature, use [Equation 6](#).

$$P_{\text{D(MAX)}} = \frac{T_{\text{J(MAX)}} - T_{\text{A}}}{R_{\theta\text{JA}}}$$

where

- $P_{\text{D(max)}}$  is the maximum allowable power dissipation
  - $T_{\text{J(max)}}$  is the maximum allowable junction temperature (125°C for the TPS22968)
  - $T_{\text{A}}$  is the ambient temperature of the device
  - $R_{\theta\text{JA}}$  is the junction to air thermal impedance. See the [Thermal Information](#) table. This parameter is highly dependent upon board layout.
- (6)

[Equation 7](#) to [Equation 10](#) and [Equation 11](#) to [Equation 13](#) show two examples to determine how to use this information correctly:

For  $V_{\text{BIAS}} = 5 \text{ V}$ ,  $V_{\text{IN}} = 5 \text{ V}$ , the maximum ambient temperature with a 4-A load through each channel can be determined by using [Equation 7](#) to [Equation 10](#):

$$P_{\text{D}} = I^2 \times R \times 2 \text{ (multiplied by 2 because there are two channels)} \quad (7)$$

$$2 \times I^2 \times R = \frac{T_{\text{J(MAX)}} - T_{\text{A}}}{R_{\theta\text{JA}}} \quad (8)$$

$$T_{\text{A}} = T_{\text{J(MAX)}} - R_{\theta\text{JA}} \times 2 \times I^2 \times R \quad (9)$$

$$T_{\text{A}} = 125^\circ\text{C} - 62.5^\circ\text{C/W} \times 2 \times (4 \text{ A})^2 \times 27 \text{ m}\Omega = 71^\circ\text{C} \quad (10)$$

For  $V_{\text{BIAS}} = 5 \text{ V}$ ,  $V_{\text{IN}} = 5 \text{ V}$ , the maximum continuous current for an ambient temperature of 85°C with the same current flowing through each channel can be determined by using [Equation 11](#) to [Equation 13](#):

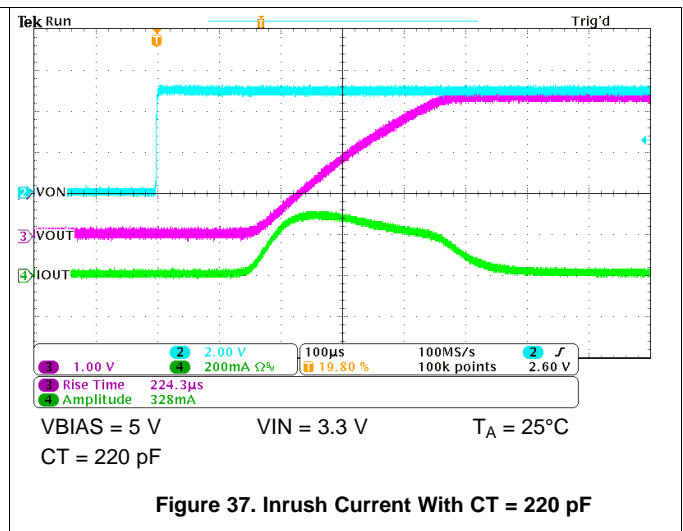

$$2 \times I^2 \times R = \frac{T_{\text{J(MAX)}} - T_{\text{A}}}{R_{\theta\text{JA}}} \quad (11)$$

$$I = \sqrt{\frac{T_{J(MAX)} - T_A}{2 \times R \times R_{\theta JA}}} \tag{12}$$

$$I = \sqrt{\frac{125^{\circ}\text{C} - 105^{\circ}\text{C}}{2 \times 27\text{m}\Omega \times 62.5^{\circ}\text{C/W}}} = 3.44 \text{ A per channel} \tag{13}$$

### 10.2.3 Application Curves

The twp scope captures show the usage of a CT capacitor in conjunction with the device. A higher CT value results in a slower rise and a lower inrush current.

## 11 Power Supply Recommendations

The device is designed to operate from a  $V_{BIAS}$  range of 2.5 V to 5.5 V and  $V_{IN}$  range of 0.8 V to 5.5 V. This supply must be well regulated and placed as close to the device pin as possible with the recommended 1- $\mu$ F bypass capacitor. If the supply is located more than a few inches from the device pins, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10  $\mu$ F may be sufficient.

## 12 Layout

### 12.1 Layout Guidelines

- $V_{IN}$  and  $V_{OUT}$  traces must be as short and wide as possible to accommodate for high current.
- Use vias under the exposed thermal pad for thermal relief for high current operation.
- $V_{INx}$  pins must be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1- $\mu$ F ceramic with X5R or X7R dielectric. This capacitor must be placed as close to the device pins as possible.
- $V_{OUTx}$  pins must be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the  $V_{INx}$  bypass capacitor of X5R or X7R dielectric rating. This capacitor must be placed as close to the device pins as possible.
- The  $V_{BIAS}$  pin must be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 0.1- $\mu$ F ceramic with X5R or X7R dielectric.
- The  $CTx$  capacitors must be placed as close to the device pins as possible. The typical recommended  $CTx$  capacitance is a capacitor of X5R or X7R dielectric rating with a rating of 25 V or higher.

### 13.4 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 13.5 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 13.6 Trademarks

E2E is a trademark of Texas Instruments.

Ultrabook is a trademark of Intel.

### 13.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 13.8 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## THERMAL PAD MECHANICAL DATA

DPU (R-PWSON-N14)

PLASTIC SMALL OUTLINE NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

DPU (R-PWSON-N14)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
